SECURITY

SETUP WITH GROUPTALK

Security companies are often innovators when it comes to leveraging new technology to increase safety and improve efficiency. Adding new solutions has historically been challenging due the complexity in deployment and interaction between systems. Modern "cloud based" services facilitate the daily work and at the same time simplify future service upgrades.

CHALLENGE

Group communication and personal alarms are crucial for effective customer management and personnel safety. Traditional setups typically consists of a radio solution in combination with a separate system for alarms, requiring the personnel to carry two devices. It is desirable to reduce the number of devices carried by the field personnel due to weight and cost. Some customers are considering replacing analog radio systems with new digital radio systems to add personal alarm, but coverage, sound quality, location tracking and the limited functionality of these devices are often hard to accept considering the cost.

✔ SOLUTION

Implementing the solution from GroupTalk solves all of the above, without jeopardising communication or guard security. A standard iOS or Android based smartphone used with a Push to Talk accessory is the only thing needed for communication and personal alarm in the field. The GroupTalk PC dispatcher supports the Security Central with a full overview of the operation including queue functionality, direct calls, location tracking, etc. for efficient management of the personnel.
